ABSTRACT OF THE DISCLOSURE

An imaging optical system images a onedimensional image on an image surface by regarding as an
object a light modulator element which has light
modulator parts arranged one-dimensionally in a first
direction, and regarding a bundle of rays from the light
modulator element as an object light. The imaging
optical system includes at least two anamorphic surfaces
each having radii of curvature which are different on an
object surface in the first direction and a second
direction which is perpendicular to the first direction,
so that imaging surfaces in the first and second
directions match.
